Adding a cron job in the hosting panel

Hosting panel · https://kyzoe.be/en/docs/adding-a-cron-job-in-the-hosting-panel/

With a **cron job** you can have tasks run automatically at set times. Think, for example, of running a script, cleaning up files or scheduling maintenance tasks for your website.

How to add a cron job:

- Log in to your **website dashboard**.
- Go to **Advanced** and choose **Cron Jobs**.
- Click **Add Cron Job**.
- Enter the **command** you want to run and set the **schedule** (for example every hour, daily or weekly).
- Click **Save** to activate the cron job.

The cron job will now run automatically according to the schedule you set.

> **Tip:** Be careful with cron jobs that run too frequently. Too high a frequency can cause unnecessary server load.
