Catch-all email addresses

Email · https://kyzoe.be/en/docs/catch-all-email-addresses/

A catch-all email address is set up to receive all messages sent to **any email address within a domain**, even if the address does not exist or is misspelt.

For example: if **hello@domain.com** is set up as a catch-all, this email address will also receive emails sent to **helo@domain.com**, **hi@domain.com**, and other variations.

Creating a catch-all email address:

1. In your website dashboard, go to **Emails**
2. Click **Add account**
3. Fill in the form and select **Make this email address a catch-all**
4. Click **Save**

Converting an existing email address into a catch-all:

1. **Only one catch-all email address can be created per domain.**
2. In your website dashboard, go to **Emails**
3. Find the email address you want to convert and click **Manage**
4. Scroll to **Catch-all**
5. Switch on the **Catch-all** toggle
