Two-factor authentication (2FA)

Hosting panel · https://kyzoe.be/en/docs/two-factor-authentication-2fa/

Two-factor authentication helps protect a user's account by adding an extra layer of security. Once two-factor authentication is enabled, both a password and a time-sensitive code are required to access an account.

Two-factor authentication is enabled per account.

To enable two-factor authentication:

- Log in at https://cp.vcloudhostiung.eu
- Click the avatar (top right) in the dashboard and select "My account"
- Scroll to "Two-factor authentication" and click "Enable two-factor authentication"
- Open your two-factor authentication app (Google Authenticator or similar) and choose to add an account. Scan the QR code that appears on the screen

When you enable two-factor authentication, you are automatically logged out of the Enhance panel. The next time you log in, you will need both your password and the time-sensitive code!
